The dissertation examines empirical issues related to health and labor economics. It has long been debated whether breastfeeding leads to a higher intelligence quotient (IQ) and greater scholastic achievement. The first study empirically examines the issue. Many past studies fail to take into account the possible endogeneity of the breastfeeding decision and thus falsely identify the correlation between breastfeeding and IQ as a causal relationship. We attempt to distinguish the causation and correlation between the two variables. Our results show that, after controlling for possible endogeneity, breastfeeding has no significant impact on IQ or scholastic achievement. The second essay examines the link between breastfeeding and childhood obesity. Health economics researchers view breastfeeding as a determining factor as to whether a child becomes obese. There are many theories, involving both biological and psychological factors, as to why breastfeeding is negatively linked to childhood obesity. This essay argues that the breastfeeding decision is not an exogenous one, so estimation technique such as ordinary least squares is not the correct way to estimate the relationship between breastfeeding and childhood obesity. Instruments are used to generate exogenous variations in the breastfeeding variable. After correcting for any estimation bias due to the breastfeeding variable being endogenous, this study documents the benefits of breastfeeding. The third essay analyzes 19 semesters of student evaluations at Kansas State University. Faculty fixed effects are sizable and indicate that, as assessed by students, the best principles

teachers also tend to be the best non-principles teachers. OLS estimates are biased because principles teachers are drawn from the top of the distribution and because unmeasured faculty characteristics are correlated with such variables as the response rate and student effort. Student ratings are lowest for new faculty but stabilize quickly. Expected GPA of the class is not an important determinant of student ratings, but equitable grading is; and the rewards for equitable grading appear larger for principles classes. The lower ratings in principles classes are fully accounted for by greater class size.

Essay aus dem Jahr 2015 im Fachbereich Anglistik - Kultur und Landeskunde, Note: 1,3, Ruhr-Universität Bochum, Sprache: Deutsch, Abstract: In her essay "Fat Kids, Working Moms, and the Epidemic of Obesity" "Race, Class, and Mother Blame" Natalie Boero discusses the blaming of mothers for the fatness of their children by referring to recent newspaper articles about childhood obesity and preventive programs. Besides the common and popular explanations for childhood fatness like the consumption of too much fast food, too much time in front of the television and too little exercise, the role of mothers is considered to be another important reason for the "epidemic of childhood obesity". This trend, namely the trend of "mother blame" holds mothers and especially working mothers responsible for the weight of their children by bringing the child's weight in connection to good mothering.

Children's health has made tremendous strides over the past century. In general, life expectancy has increased by more than thirty years since 1900 and much of this improvement is due to the reduction of infant and early childhood mortality. Given this trajectory toward a healthier childhood, we begin the 21st-century with a shocking development—"an epidemic of obesity in children and youth. The increased number of obese children throughout the U.S. during the past 25 years has led policymakers to rank it as one of the most critical public health threats of the 21st-century. Preventing Childhood Obesity provides a broad-based examination of the nature, extent, and consequences of obesity in U.S. children and youth, including the social, environmental, medical, and dietary factors responsible for its increased prevalence. The book also offers a prevention-oriented action plan that identifies the most promising array of short-term and longer-term interventions, as well as recommendations for the roles and responsibilities of numerous stakeholders in various sectors of society to reduce its future occurrence. Preventing Childhood Obesity explores the underlying causes of this serious health problem and the actions needed to initiate, support, and sustain the societal and lifestyle changes that can reverse the trend among our children and youth.

Nearly 1 in 5 school-age children and young people in the United States has obesity. This must-have volume offers insight into childhood obesity, its effects, and treatment options available. Readers will learn about the increased health risks associated with the condition, and hear personal accounts from sufferers.

This report issues a call for urgent action to combat the growing epidemic of obesity, which now affects developing and industrialized countries alike. Adopting a public health approach, the report responds to both the enormity of health problems associated with obesity and the notorious difficulty of treating this complex, multifactorial disease. With these problems in mind, the report aims to help policy-makers introduce strategies for prevention and management that have the greatest chance of success. The importance of prevention as the most sensible strategy in developing countries, where obesity coexists with undernutrition, is repeatedly emphasized. Recommended lines of

action, which reflect the consensus reached by 25 leading authorities, are based on a critical review of current scientific knowledge about the causes of obesity in both individuals and populations. While all causes are considered, major attention is given to behavioural and societal changes that have increased the energy density of diets, overwhelmed sophisticated regulatory systems that control appetite and maintain energy balance, and reduced physical activity. Specific topics discussed range from the importance of fat content in the food supply as a cause of population-wide obesity, through misconceptions about obesity held by both the medical profession and the public, to strategies for dealing with the alarming prevalence of obesity in children. The report has eleven chapters presented in five parts. Part one, which assesses the magnitude of the problem, explains the system for classifying overweight and obesity based on the body mass index, considers the importance of fat distribution, and provides an overview of trends in all regions of the world, concluding that obesity is increasing worldwide at an alarming rate. Chapters in part two evaluate the true costs of obesity in terms of physical and mental ill health, and the human and financial resources diverted to deal with these problems. Specific health consequences discussed include increased risk of cardiovascular disease, cancer, and other noncommunicable diseases, endocrine and metabolic disturbances, debilitating health problems, and psychological problems. The health benefits and risks of weight loss are also assessed. Part three draws on the latest research findings to consider specific factors involved in the development of overweight and obesity. Discussion centres on factors, such as high intakes of fat, that may disrupt normal physiological regulation of appetite and energy balance, and the role of dietary factors and levels of physical activity. In terms of opportunities for prevention, particular attention is given to the multitude of environmental and societal forces that adversely affect food intake and physical activity and may thus overwhelm the physiological regulatory systems that keep weight stable in the long term. The possible role of genetic and biological susceptibility is also briefly considered. Against this background, the fourth and most extensive part maps out strategies for prevention and management at both the population and individual levels. Separate chapters address the need to develop population-based strategies that tackle the environmental and societal factors implicated in the development of obesity, and compare the effectiveness of current options for managing overweight or obese individuals. Specific strategies discussed include dietary management, physical activity and exercise programmes, behaviour modification, drug treatment, and gastric surgery. While noting striking recent progress in the development of drug treatments, the report concludes that gastric surgery continues to show the best long-term success in treating the severely obese. The final part sets out key conclusions and recommendations for responding to the global obesity epidemic and identifies priority areas where more research is urgently needed. "... the volume is clearly written, and carries a wealth of summary information that is likely to be invaluable for anyone interested in the public health aspects of obesity and fatness, be they students, practitioner or researcher." - Journal of Biosocial Science

Australia has become the fattest nation in the world. According to the latest figures, 4 million Australians (26% of adults) are obese, and another 5 million are considered overweight. Another report concludes that 17% of Australian children are overweight, and 6% are obese. What are we doing to counter these alarming trends? The health consequences of obesity are many and varied, and include cardiovascular disease, cancer, diabetes, and hypertension. This book presents a detailed study of obesity in Australia and includes: the latest overweight and obesity statistics; the Body Mass Index (BMI) and measuring weight; the health risks of obesity; tackling overweight/obesity among children, including unhealthy food and beverage advertising aimed at them; and presents a range of approaches to maintaining healthy weight through diet and exercise.
